

CloudSync

Complete Troubleshooting Handbook

Version 3.2 | Support Reference Document

About This Document

This handbook is the official troubleshooting reference for CloudSync Support Representatives and technically proficient customers. It covers the most common issues across all product areas with step-by-step resolution guides, diagnostic commands, and escalation criteria.

Section 1: Login and Authentication Issues

1.1 Cannot Log In - Checklist

- **Step 1:** Verify the email address is correct — check for typos, extra spaces
- **Step 2:** Confirm Caps Lock is not enabled when entering password
- **Step 3:** Try password reset via the 'Forgot Password' link
- **Step 4:** Clear browser cookies and cache, then retry
- **Step 5:** Try a different browser or incognito/private window
- **Step 6:** Check for account lockout (5 failed attempts triggers lockout)
- **Step 7:** Wait 15 minutes if temporarily locked out
- **Step 8:** Contact support if issue persists after all above steps

1.2 Two-Factor Authentication Problems

If a user cannot complete 2FA verification, follow this resolution path:

- User has authenticator app but code not working:
 - Check device time sync (most common cause — TOTP requires accurate time)
 - Android: Settings → General Management → Date and Time → Automatic

- iOS: Settings → General → Date & Time → Set Automatically
- User has backup codes: Use one backup code to log in, then re-setup 2FA
- User has no backup codes and no authenticator access: Requires identity verification via support

1.3 SSO/SAML Authentication Failures

Enterprise SSO errors require coordination between the customer's IT team and CloudSync. Common SAML error codes and their meanings:

Error Code	Meaning	Resolution
SAML_INVALID_SIGNATURE	Certificate mismatch	Re-upload IdP metadata certificate
SAML_EXPIRED_RESPONSE	Clock skew > 5 minutes	Sync server time on IdP
SAML_NO_ATTRIBUTE	Required attribute missing	Map email attribute in IdP config
SAML_INVALID_RECIPIENT	Wrong ACS URL	Update ACS URL in IdP to match CloudSync
USER_NOT_PROVISIONED	User not in SCIM	Add user to provisioning group in IdP

Section 2: Data Sync and Recovery

2.1 Sync Failure Diagnostic Tree

Use this decision tree to diagnose sync failures systematically:

Is the sync status indicator green, yellow, or red?

- GREEN: Sync is working. Perceived issue may be user error or UI caching.
- YELLOW: Sync is delayed. Check status.cloudsync.io for ongoing incidents.
- RED: Sync stopped. Proceed to step 2.

Is the device connected to the internet?

- NO: Reconnect to internet. Offline changes will sync automatically.
- YES: Proceed to step 3.

Use 'Force Sync' (Ctrl+Shift+S / Cmd+Shift+S). Does sync complete?

- YES: Intermittent issue resolved. Monitor for recurrence.
- NO: Check sync error logs at Dashboard → Developer → Sync Logs.

Are there error messages in sync logs?

- AUTH_ERROR: API key may have expired. Regenerate at Settings → API Keys.
- QUOTA_EXCEEDED: Storage limit reached. Upgrade plan or free up space.

- CONFLICT_LOOP: Contact support — manual conflict resolution required.
- No errors but sync not working: Escalate to Tier 2 support.

2.2 Data Recovery Procedures

IMPORTANT: Always confirm with the customer what data is missing before attempting recovery. Incorrect recovery can overwrite newer data.

Recovery Option 1 — Trash Recovery (0-30 days):

- Navigate to Data → Trash
- Search for the deleted record by name or date
- Click Restore to return to original location

Recovery Option 2 — Version History:

- Open the affected record
- Click History tab on the right sidebar
- Browse versions with timestamp and editor info
- Click Restore on any version to roll back

Recovery Option 3 — Backup Restore (Enterprise Only):

- Contact Enterprise support for point-in-time restore
- Provide: workspace ID, target restore time, scope of data
- Estimated restoration time: 2-4 hours depending on data volume

Section 3: API and Integration Troubleshooting

3.1 API Error Code Reference

HTTP Code	Error Type	Most Common Cause	Resolution
400	Bad Request	Invalid JSON or missing required field	Validate request body against API docs
401	Unauthorized	Invalid or expired API key	Regenerate API key, check Authorization header
403	Forbidden	Insufficient permissions	Check API key permissions or user role
404	Not Found	Wrong endpoint or deleted resource	Verify endpoint URL and resource existence

409	Conflict	Duplicate unique field value	Check for existing record, use PATCH instead of POST
422	Unprocessable	Validation failure on field value	Check field format requirements in API docs
429	Rate Limited	Too many requests	Implement backoff, reduce request frequency
500	Server Error	CloudSync internal error	Retry with backoff, report if persistent
503	Unavailable	Service maintenance or overload	Check status page, retry after Retry-After header

3.2 Debugging API Calls

Use these curl commands for quick API debugging:

```
# Test authentication curl -H 'Authorization: Bearer YOUR_API_KEY' \
https://api.cloudsync.io/v2/me # Test with verbose output curl -v -H
'Authorization: Bearer YOUR_API_KEY' \
https://api.cloudsync.io/v2/records?limit=1 # Test with timing info curl -w
'@curl-format.txt' -H 'Authorization: Bearer KEY' \
https://api.cloudsync.io/v2/health
```

Section 4: Escalation Guide

4.1 When to Escalate

Tier 1 → Tier 2:

- Issue not resolved after following all standard troubleshooting steps
- Customer reports data loss or corruption
- Authentication/SSO failure not resolved by re-authorization
- Sync errors persisting after Force Sync and cache clear
- Customer requests access to audit logs beyond their plan

Tier 2 → Engineering:

- Suspected bug with reproducible steps
- Performance degradation without clear cause
- Data inconsistency that cannot be explained
- Security incident or suspected breach
- Infrastructure-level issues not shown on status page

Any Tier → Legal/Finance:

- Customer mentions legal action or regulatory investigation

- Billing disputes exceeding \$1,000
- GDPR data deletion or access requests
- Requests for compliance documentation with NDA
- Subpoena or law enforcement requests

4.2 Escalation Handoff Checklist

- Customer name, account email, workspace ID
- Plan type and contract details
- Clear description of the issue with exact error messages
- Steps already attempted and their results
- Customer's urgency level and business impact
- Any screenshots or screen recordings shared by customer
- API request IDs for technical issues
- Timeline of when issue started
- Whether issue is affecting all users or specific ones
- Customer's preferred contact method for follow-up
